AB Activated carbon catalysts contg. <5% ash, useful for cyclotrimerization of CNCl to **cyanuric chloride**, are prep'd. from activated carbon with 9-12% ash by boiling with HCl soln. in a closed reactor for 20 h and drying for ≥ 6 h at 600° in an inert gas. Thus, activated carbon (av. particle size 4 mm, sp. **surface area** 1000 m²/g, bulk d. 0.65 ton/m³, compressive strength 2.0-4.0 kg/granule, ash content 9-12%) was treated in 25% HCl at 75-84% for 20 h in a closed reactor. The treated material was then washed with H₂O and dried under N at 600° for 8 h. The resulting activated carbon catalyst contained .apprx.5% ash, its compressive strength was 0.8 kg/granule, while its other properties remained unchanged. The sp. consumption of this catalyst in CNCl cyclotrimerization was 60 kg/ton which was less than that of catalysts prep'd. by conventional methods.

L23 ANSWER 1 OF 10 HCA COPYRIGHT 2004 ACS on STN
129:163570 Combustion behavior and flame structure of tetrazole
derivatives. Sinditskii, Valery P.; Egorshev, Viachcheslav Y.;
Fogelzang, Alexander E.; Serushkin, Valery V.; Kolesov, Vasilii I.
(Mendeleev Univ. Chemical Technology, Moscow, 125047, Russia).
International Annual Conference of ICT, 29th(Energetic Materials),
171.1-171.14 (English) 1998. CODEN: IACIEQ. ISSN: 0722-4087.
Publisher: Fraunhofer-Institut fuer Chemische Technologie.
AB Combustion behavior of tetrazole and 5-chlorotetrazole was studied
in the form of pressed strands in a window const. pressure bomb at
0.1-36 MPa. Temp. profiles in the combustion wave were measured by
thin W-Re thermocouples embedded in the strands. Analyses of
condensed combustion products were carried out by IR
spectrophotometry. The principal feature of tetrazole combustion
consists in formation of stable energetic nitrile derivs. in the
combustion products rather than equil. adiabatic compn., resulting
in incomplete heat release. In spite of decompn. nature of the
rate-controlling reactions, they prove to be different than those in
slow thermal decompn. at 150-250°. By the example of
tetrazole, a new combustion regime was suggested, characterized by
variations in the surface temp. The periodic process involves a
gradual accumulation of a product of high decompn./boiling temp. at
the burning surface, followed by ejecting thereof in the gas and
clearing the surface.

AB A process for prepg. ClCN comprises reacting HCN with Cl in 25-75% molar excess at 250-90° in the presence of a low-**activity C** catalyst having a CCl₄ activity of 1-10. The catalyst contact time is 1-5 sec. The reaction produces a gas mixt. contg. ClCN, HCl, Cl, and small amts. of **cyanuric chloride** and HCN. The mixt. is cooled to remove the **cyanuric chloride** and then treated with H₂O to remove HCl and HCN. The remaining gas is fractionated to sep. ClCN and Cl.

cyanogen chloride. Landau, M. A.; Malinin, N. K.
Zhurnal Fizicheskoi Khimii, 39(3), 779 (Russian) 1965. CODEN:
ZFKHA9. ISSN: 0044-4537.
AB Homogeneous trimerization of **cyanogen chloride**
(I) to cyanur chloride (II) was accelerated by the addn. of II to
1-g. samples of I contained in quartz tubes and converted by heating
in an autoclave in the presence of 0.015 g. water acting as
catalyst. After a reaction time of 60 min. at 240° (time of
heating 70 min.) 89% I was converted (yield of II 69% by wt. with
respect to the amt. of I that reacted) upon addn. of 0.1 g. II, and
100% I was converted (yield of II 82-90%) upon addn. of 0.25-1.0 g.
II vs. a conversion of 55% (yield of II 55%) in a reaction under the
same conditions without addn. of II. After a reaction time of 20
min. at 240° (time of heating 40 min.), the amt. of I
converted was 0 without addn. of II, 27% on addn. of 0.1 g. II, and
75% on addn. of 0.5 g. II. One may assume that II accelerates the
reaction by acting as a matrix for 3 activated mols. of I. In
heterogeneous trimerization of vapor of I on **activated**

C, preliminary treatment of C with vapor of II also increased the rate of conversion (Japan. 2282-3('59), CA 54, 11414d).

80:28858 Modeling of processes with variable catalyst activity using a hybrid computer. Markaryan, A. G.; Sidorov, V. N.; Matros, Yu. Sh. (USSR). Upravlyaemye Sist., No. 10, 90-5 From: Ref. Zh., Khim. 1973, Abstr. No. 8I215 (Russian) 1971.

AB Modeling of a series of catalytic processes with a hybrid computer was accomplished. In steady-state catalytic processes, the machine times were reduced by 1-2 order of magnitude as compared with the digital computer with total soln. error 0.4-0.6%. A procedure using hybrid computer is given for modeling heterogeneous catalytic processes with a variable catalytic activity, based on the method of straight lines under the following conditions: (1) the rate of change of the catalyst activity is significantly lower than the reaction rate; the process in the internal catalyst layer is under steady state; (2) linear flow rate of the reacting mixt. with respect to the reaction rate; (3) longitudinal mass and heat transfer on account of the effective diffusion and thermal cond. is unessential; (4) concn. and temp. gradients in the radial direction are small; and (5) the input parameters (temp., compn., pressure)

change with time. Math. description of an unsteady-state process is given in a vector form. The analog computer is feasible for integration and multiplication, and a digital computer is feasible for multiplication, division, logic operations, and calcn. of nonlinearities. **Trimerization of CNCl on active carbon** was studied, and concn. and temp. profiles along the length of the reactor are given.

L31 ANSWER 5 OF 7 HCA COPYRIGHT 2004 ACS on STN

72:4811 Recovery of cyanogen chloride, chlorine, and hydrochloric acid from the gases accumulated during the production of cyanogen chloride and its trimer. Riethmann, Jean A.; Scheck, Leo (Agrispat, S. A.). Ger. Offen. DE 1900972 19690904, 13 pp. (German). CODEN: GWXXBX. APPLICATION: DE 1969-1900972 19690109.

AB Dry HCN and Cl react over an **active carbon**

catalyst at 350° to form (ClCN)₃ through the intermediate formation of **ClCN** followed by **trimerization**.

The recovery of HCl in high concn. from the residual gases and the recycle of Cl and ClCN are important economic problems. After condensation of (ClCN)₃, the residual gases contg. HCl, Cl, and ClCN (65:33:2 by vol.) were freed from moisture and other polar solvents and then were liquefied by cooling in a fractionating plant. Fractional distn. of the liquefied gases at normal pressure and at -40 to -20° sep. completely liq. HCl from the ClCN-Cl mixt. The ClCN-Cl mixt. was then recycled for (ClCN)₃ production. It is long known that HCl and Cl strongly catalyze the polymn. of ClCN to (ClCN)₃ at low temp. The absence of H₂O is thought to be the reason for the absence of polymn. during the fractional distn. of the mixt. In an example, the residual gases (HCl 50, Cl 48, and ClCN 2 parts by wt.) of the catalytic production of (ClCN)₃ was fed to the distn. column and fully condensed by cooling to -100 to -103° in a heat exchanger using difluorochloromethane under .apprx.15 mm pressure. The liq. collecting in the distn. still was heated to -31 to -25°. The HCl contg. 0-2.5 parts Cl was taken from the top and liq. contg. HCl .apprx.2.5, Cl 46.5 and ClCN 2 parts was taken continuously from the bottom of the column. (ClCN)₃ was absent in the distillate as well as in the liq. in the still.

62:74280 Original Reference No. 62:13163a-c Cyanuric chloride. Foulletier, Louis; Markiewicz, Michel (Societe d'Electro-Chimie, d'Electro-Metallurgie et des Acieries Electriques d'Ugine). DE 1186465 19650204, 3 pp. (Unavailable). PRIORITY: FR 19611028.
- AB Cyanuric chloride was prepd. by the catalytic **trimerization** of **ClCN**, and if desired, while simultaneously producing ClCN from Cl and HCN in the vapor phase at 250-450° over **activated C**. An excess of free Cl, (0.5 mole Cl per mole ClCN) was used. E.g., ClCN was prepd. by reacting excess Cl with HCN in the presence of **activated C** at 200-50° and at a high reactor velocity (100-200 l./hr./l catalyst). After removing the HCl by washing with H₂O, the ClCN and excess Cl were dried over CaCl₂ and passed through fresh **activated C**. At 470, 385, and 370°, resp., and at a space velocity (l./hr./l. catalyst) of 70, 67, and 62, resp., and a ratio of Cl₂: ClCN of 0.73, 0.84, and 0.79, the yield of (CNCl)₃ was 25, 74, and 83%. The catalyst showed no loss of activation after a reaction life of 200 hrs. In considering the equation: 3 ClCN → (ClCN)₃, it is seen that the use of 2 reactors placed in series with a (ClCN)₃ condenser placed between them is more effective than a single reactor. It is seen from the above results that it is advantageous to use the lowest possible temp. This process makes use of this optimum condition, since the catalyst remains active at these temps., but in other known processes this is not the case.

AB Quantum mech. calcns. [ab initio and d. functional theory (DFT)] were performed to investigate reaction of mechanisms for formation and decompn. of the six-membered rings $C_3N_3X_3$, where X denotes Cl or H. $C_3N_3Cl_3$ (**cyanuric chloride**) and $C_3N_3H_3$ (sym-triazine) are the polymn. products of agents CK (ClCN) and AC (HCN). The process of the polymn. to the trimer species of CK and AC has long been rumored to be highly exothermic and thought to be the cause of explosions of cylinders contg. these agents. The calcns. presented here det. energy release upon reaction, activation barriers and details of the reaction mechanisms for the polymn. of these agents. The calcns. investigate concerted triple assocn. and step-wise addn. reactions leading to the trimers, and provide information on the low-energy pathway to polymn. Ab initio MP2 and non-local DFT geometry optimizations for crit. points on the CK and AC potential energy surfaces were calcd. with the 6-311 + G* and cc-pVTZ basis sets, resp. The MP2 calcns. were followed by QCISD(T) energy refinements for the AC system. Good agreement with expts. is found for the predicted geometries and frequencies of sym-triazine, HCN, ClCN and **cyanuric chloride**. All calcns. indicate that CK and AC have similar features on the potential energy surfaces for the trimerization reactions. All calcns. show that the lowest-energy formation mechanism for trimerization is the concerted triple assocn. In both chem. systems, a weakly-bound $(XCN)_3$ cluster is a pre-reaction intermediate to the trimerization. This reduced entropic hindrance to the unusual concerted triple assocn. of the CK and AC mols. Both systems have a large energy release upon trimerization and similar barriers to activation of the reactions. The energy available to the surrounding system upon crossing the reaction barrier is sufficient to initiate chain reactions. Preliminary studies on polymn. reactions of AC and CK to the tetramers predict significant energy release that could initiate addnl. reactions.

L22 ANSWER 4 OF 25 HCA COPYRIGHT 2004 ACS on STN

127:110559 Kinetics of chlorination and trimerization in synthesis of cyanuryl chloride. Wang, Zhangmao; Jiang, Guangguan; Lu, Dewei; Wu, Wenbin; Jiang, Yinrui; Jin, Mingchang; Liu, Qing (Dep. Chem. Eng., Zhejiang Univ., Hangzhou, 310027, Peop. Rep. China). Huaxue Fanying Gongcheng Yu Gongyi, 13(2), 165-172 (Chinese) 1997. CODEN: HFGGEU. ISSN: 1001-7631. Publisher: Zhejiangsheng Chuban Duiwai Maoyi Gongsì.

AB A nonisothermal packed bed reactor has been used to study the kinetics of chlorination and trimerization in synthesis of cyanuryl chloride. The chlorination reaction of hydrogen cyanide is a homogeneous gas phase, while the trimerization of chloro-cyanogen adsorbed on the surface of **active carbon** catalyst is the controlling step of G/S catalytic reaction. The macrokinetics equation of chlorination reaction is $(-r_A)_1 = 2.45 \times 10^7 \exp(-2.90 \times 10^4/RT)C_A$. The macrokinetics equation of the trimerization reaction is $(-r_A)_2 = k [p_{A3} - p_R/k_p]/[1 + k_A p_A + k_R p_R]^3$. In the above equations the parameters are: $k = 4.0 \times 10^7 \exp(-4.35 \times 10^4/RT)$, $K_p = 6.76 \times 10^{-23} \exp(3.52 \times 10^5/RT)$, $K_A = 4.0 \times 10^3$

$\exp(-3.39 \times 104/RT)$, $KR = 1.05 \times 103 \exp(-5.02 \times 104/RT)$.

AB From trichlorotrithiatriazine (ClSN)₃ and **cyanogen chloride** (ClCN) 1,3,5-trichloro-1,3,2,4,6-dithiatriazine (ClCN)(ClSN)₂ (I) was prepd. in 26% yield. I reacts slowly further with excess **cyanogen chloride** to give thiatriazine (ClSN)₂(ClCN) (II) and trichlorotriazine (ClCN)₃. A mechanism for the (ClSN)/(ClCN) exchange is proposed. The structures of I and II were detd. by x-ray diffraction. The bonding situation in the system (ClSN)_n(ClCN)_{3-n} (n = 0-3) is discussed.

106:69123 Apparatus for manufacture of solid **cyanuric chloride**. Klima, Hubertus (SKW Trostberg A.-G., Fed. Rep. Ger.). Ger. Offen. DE 3514840 A1 19861030, 9 pp. (German). CODEN: GWXXBX. APPLICATION: DE 1985-3514840 19850424.

AB Solid **cyanuric chloride** (I) is prepd. from the trimerization of CNCl, where I vapors are added to the bottom of an app. with an inert gas stream (velocity >80 m/s, -80°-+100°) causing I vapors to condense and to leave the app. as I powder (d. <800 kg/m³); the inert gas is removed through an exit in the side of the app. Thus, the described reactor was fed 100 parts/h I and 50 parts/h of an inert gas. The temp. of the entering inert gas stream was 20°, and its velocity was 330 m/s. The d. of obtained I powder was 760 kg/m³.

78:72220 Catalytic production of **cyanuric chloride**.

Suryanarayana, Yelagondahally S.; Reid, Luther J., Jr. (Ciba-Geigy Corp.). U.S. US 3707544 19721226, 2 pp. (English). CODEN: USXXAM.
 APPLICATION: US 1971-142358 19710511.

AB The life of the C catalyst for trimerization of **cyanogen chloride** (I) to **cyanuric chloride** (II)

is approx. doubled by mixing with a solid diluent. Such mixed catalysts generate lower temps. and fewer hot spots. Thus, a 50:50 mixt. of CXAC catalyst (Union Carbide) and porcelain chips was used in the prodn. of II from I in a 20' tube reactor. A temp. of 470° was noted; with CXAC alone, 502° was measured.

AB ClCN is prepd. by reacting liq. Cl and liq. HCN at -20 to 30°
 and 4-20 atm, preferably in the presence of an inorg. halogen compd.
 as catalyst. By increasing the reactor pressure, e.g. to 50 atm, by
 introducing an inert gas, e.g. N, the ClCN is slowly trimerized to
cyanuric chloride. Formed as a secondary product
 is 2,4-dichloro-6-(dichloromethyleneamino)-1,3,5-triazine. If only

ClCN is wanted the process is carried out in a continuous cycle in which the reaction products are contacted with **active C** catalyst at 300-400°.

L24 ANSWER 1 OF 19 HCA COPYRIGHT 2004 ACS on STN

127:81821 First principles investigations of polymerization reactions of CK and AC. Rice, Betsy M.; Pai, Sharmila V.; Chabalowski, Cary F. (U. S. Army Research Laboratory, Aberdeen Proving Ground, MD, 21005-5066, USA). Proceedings of the ERDEC Scientific Conference on Chemical and Biological Defense Research, Aberdeen Proving Ground, Md., Nov. 14-17, 1995, Meeting Date 1995, 811-817. Editor(s): Berg, Dorothy A. National Technical Information Service: Springfield, Va. (English) 1996. CODEN: 64OYA8.

AB Quantum mech. calcns. [ab initio and D. Functional Theory (DFT)] were performed to investigate reaction mechanisms for formation and decompn. of the six-membered rings $C_3N_3X_3$, where X denotes Cl or H. $C_3N_3Cl_3$ (**cyanuric chloride**) and $C_3N_3H_3$ (sym-triazine) are the polymn. products of agents CK (ClCN) and AC (HCN) which were std. and substitute fill, resp., of chem. munitions during World War II. The process of the polymn. to the trimer species of CK and AC has long been rumored to be highly exothermic and thought to be the cause of explosions of cylinders contg. these agents. The calcns. presented here det. energy release upon reaction, activation barriers and details of the reaction mechanisms for the polymn. of these agents. The calcns. investigate concerted triple assocn. and step-wise addn. reactions leading to the trimers, and provide information on the low-energy pathway to polymn. Ab initio MP2 and non-local DFT geometry optimizations for crit. points on the potential energy surfaces were calcd. with the 6-31G** 6-311++G** and cc-pVTZ basis sets. The MP2 calcns. were followed by QCISD(T) energy refinements for the AC system. Good agreement with expt. is found for the predicted geometries and frequencies of sym-triazine, HCN, ClCN and **cyanuric chloride**. All calcns. indicate that CK and AC have similar features on the potential energy surfaces for the polymn. reactions. All calcns. show that the lowest-energy formation mechanism for trimerization is the concerted triple assocn. In both chem. systems, a weakly-bound $(XCN)_3$ cluster is a pre-reaction intermediate to the polymn. This reduces entropic hindrance to the unusual concerted triple assocn. of the CK and AC mols. Both systems have a large energy release upon trimerization and similar barriers to activation of the reactions. The energy available to the surrounding system upon crossing the reaction barrier is sufficient to initiate chain reactions.

AB Ab initio and nonlocal d. functional theory (DFT) calcns. were performed to det. reaction mechanisms for formation of the six-membered ring C3N3Cl3 (**cyanuric chloride**) from the monomer **cyanogen chloride** (ClCN). MP2 geometry optimizations followed by QCISD(T) energy refinements and corrections for zero-point energies for crit. points on the potential energy surface were calcd. using the 6-31G* and 6-311+G*

basis sets. DFT (B3LYP) geometry optimizations and zero-point corrections for crit. points on the potential energy surface were calcd. with the 6-31G*, 6-311+G*, and cc-pVTZ basis sets. Good agreement is found for MP2 and DFT geometries and frequencies of **cyanuric chloride** and ClCN when compared with exptl. values. Two formation mechanisms of **cyanuric chloride** were investigated, the concerted triple assocn. ($3\text{ClCN} \rightarrow \text{cyanuric chloride}$) and the stepwise assocn. ($3\text{ClCN} \rightarrow \text{Cl}_2\text{C}_2\text{N}_2 + \text{ClCN} \rightarrow \text{cyanuric chloride}$). All calcns. show that the lower energy path to formation of **cyanuric chloride** is the concerted triple-assocn. MP2 and DFT intrinsic reaction coordinate calcns. starting from the transition state for concerted triple assocn. reaction proceeding toward the isolated monomer resulted in the location of a local min., stable by as much as -8.0 kcal/mol, that corresponds to a weakly-bound cyclic (ClCN)₃ cluster. The existence of this cluster on the reaction path for the concerted triple assocn. could lower the entropic hindrance to this unusual assocn. reaction mechanism. The DFT/cc-pVTZ barrier to concerted triple assocn. relative to isolated ClCN is 42.9 kcal/mol. The QCISD(T)//MP2/6-311+G* barrier to concerted triple assocn. is 41.0 kcal/mol. The DFT/cc-pVTZ barrier to formation of the dimer (stepwise assocn. reaction) is 63.4 kcal/mol while the QCISD(T)//MP2/6-311+G* barrier is 76.7 kcal/mol. The barrier to formation of **cyanuric chloride** relative to the (ClCN)₃ min. requires .apprx.46-49 kcal/mol, indicating that the concerted triple-assocn. reaction via formation of the (ClCN)₃ prereaction intermediate is the lower energy path to formation of **cyanuric chloride**. The temp.-cor. (T = 298 K) heats of reaction for formation of **cyanuric chloride** from ClCN are -63.4 and -61.2 kcal/mol for the B3LYP/cc-pVTZ and the QCISD(T)//MP2/6-311+G* predictions, resp.

125:339139 Non-immunogenic, biocompatible macromolecular membrane compositions, and methods for making and using same. Mares-Guia, Marcos (Biommm, Incorporated, USA). PCT Int. Appl. WO 9632098 A1 19961017, 45 pp. DESIGNATED STATES: W: BR; RW: AT, BE, CH, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE. (English). CODEN: PIXXD2. APPLICATION: WO 1996-US4534 19960403. PRIORITY: US 1995-417652 19950405.

AB Disclosed and claimed are non-immunogenic biocompatible macromol. sheet compn. pouches. The compn. is formed from a cellulosic membrane, a binding moiety having a plurality of functional groups, and a glycosaminoglycan (GAG). The binding moiety has the formula of R1-X-R2 wherein R1 and R2 are the same or different. The binding moiety, through functional groups binds the cellulosic membrane with the glycosaminoglycan. R1 is covalently bound to a carbon or an oxygen of the cellulosic membrane. R2 is covalently bound to a carbon, an oxygen, or a nitrogen of the glycosaminoglycan. The binding moiety can be bisoxirane, butanediol-diglycidyl ether (BDE), or divinyl sulfone. The cellulosic membrane can be a cellulosic membrane, partially acetylated cellulose and a copolymer of hydroxyethyl methacrylate with Me methacrylate, abbreviated as HEMA-MMA. The non-immunogenic biocompatible macromol. sheet compn. can be formed into a pouch to encapsulate cells, tissues, pharmaceuticals, or biol. metabolic products. In addn., the non-immunogenic biocompatible macromol. sheet compn. can also be used as a skin graft or a skin substitute. Further, these non-immunogenic biocompatible macromol. sheet compn. can also be used as a surface to culture cells in vitro.

102:137848 Covalently attached complex of α -1-proteinase inhibitor with a water-soluble polymer. Mitra, Gautam (Miles Laboratories, Inc. , USA). U.S. US 4496689 A 19850129, 14 pp. (English). CODEN: USXXAM. APPLICATION: US 1983-565810 19831227.
- AB A covalent complex of human glycan α 1-proteinase inhibitor with a polysaccharide or polyol is useful for treatment of pulmonary emphysema and respiratory distress syndrome. For example, 1 g dextran (mol. wt. 17,700) in 100 mL water at pH 10.7 and 20° was activated by coupling with 0.4 g CNBr for 40 min and the soln. was dialyzed. Purified α 1-proteinase inhibitor (209 mg) from Cohn fraction IV-1 was added, the pH was adjusted to 9.6, and coupling was carried at 5° for 18 h. The soln. was dialyzed and 0.7 g glycine was added to a final pH of 7.10. Catalase [9001-05-2] maybe added to the complex as an antioxidant.

87:6876 Polytriazines. Sundermann, Rudolf; Rottloff, Guenther; Grigat, Ernst (Bayer A.-G., Fed. Rep. Ger.). Ger. Offen. DE 2546355 19770421, 25 pp. (German). CODEN: GWXXBX. APPLICATION: DE 1975-2546355 19751016.

AB Diamines, aminophenols, or aminoalkanols are condensed with $\geq 1/3$ g/mol **cyanuric chloride** (I) [

108-77-0]/g-mole total amino and OH groups, treated with a different aminophenol in amts. of $\geq 1/6$ g-mole/g-mole Cl in the condensate, and then treated with a cyanogen halide, giving products which can be cyclotrimerized to crosslinked polytriazines. Thus, 0.1 mole hexamethylenediamine [124-09-4] and 0.2 mole I in dichloroethane were treated with 0.2 mole Et₃N at 20°, freed of pptd. hydrochloride, mixed with 0.4 mole p-aminophenol [123-30-8], treated with 0.4 mol Et₃N at 30-40°, refluxed 6 h, and freed of ppts. The resulting soln. was treated with 0.44 mol ClCN at 0° and 0.407 mol Et₃N, giving 69 g of a cyanate resin. When 20 g of the cyanate resin was heated 5 h at 230°, a honey-colored, very hard polytriazine was obtained.

L24 ANSWER 17 OF 19 HCA COPYRIGHT 2004 ACS on STN

69:26735 Vilsmeier adducts of dimethylformamide. Scott, M. D.; Spedding, H. (Esso Res. Centre, Esso Petrol. Co., Ltd., Abingdon, UK). Journal of the Chemical Society [Section] C: Organic (13), 1603-9 (English) 1968. CODEN: JSOOAX. ISSN: 0022-4952.

AB The reactions of HCONMe₂(DMF) with ClCN and with SOCl₂ were studied, and several of the products identified by spectroscopic methods. As in the case of a previously reported reaction between DMF and **cyanuric chloride**, Vilsmeier adducts are formed. For the ClCN reaction a mechanism is put forward that accounts for the products more satisfactorily than would the **cyanuric chloride** mechanism. Among the products, those identified are 3-dimethylamino-2-azaprop-2-enylidene-dimethylammonium chloride, 3-(N,N-dimethylcarbamoyl)-1,1-dimethylformamidine, 1,1-dimethylformamidine-HCl, 1,1-dimethylurea, 1,1-dimethylbiuret, Me₂NH.HCl, and cyanuric acid. The ClCN adduct reacts with Ph₂NH to form HCONPh₂. The adduct formed between DMF and SOCl₂ is fairly stable, but it decomp. slowly in air in a complex manner. Several of the products were identified. The adduct reacts with aniline to form 1,3-diphenylformamidine in addn. to the expected 1,1-dimethyl-3-phenylformamidine.

L24 ANSWER 18 OF 19 HCA COPYRIGHT 2004 ACS on STN

68:105256 Process for producing **cyanuric chloride**.

Kodama, Yutaka; Sasakura, Toshisuke; Takata, Saburo; Shinjo, Masaru; Nakabayashi, Masao; Tamura, Hiroaki (Toyama Chemical Industry Co., Ltd.). Brit. GB 1086706 19671011, 3 pp. (English). CODEN: BRXXAA. APPLICATION: GB 19641222.

AB **Cyanuric chloride** is prep'd. by polymg.

cyanogen chloride, or treating HCN and Cl₂ in the presence of a catalyst. A eutectic mixt. contg. AlCl₃ and (or) FeCl₃ with 1 or more halides of alkali metals, alk. earth metals, Zn, Cu, or Pb has good catalytic activity for this reaction. In an example, a eutectic mixt. of AlCl₃ and NaCl in the ratio 70:30 by wt. was heated to melting at 380-400°. **Cyanogen chloride** was bubbled through this catalyst at 18 g./hr. for 40 hrs.; 662.4 g. of **cyanuric chloride** (92% yield) of 99% purity was obtained.
